

Some random remarks

- 2016 is to professional polling agencies what 2008 was to professional credit rating agencies.
- The fact that *The Simpsons*, a satirical depiction of American life, aired a show with Trump as a ruinous president in 2000 we find telling. But now we don't know whether American life is becoming more satirical or *The Simpsons* more real.
- The fact that the US stock market in USD is outperforming most other markets is still a fact.
- Brexit and the Trump victory means that the wind behind Le Pen and the AfD (Alternative für Deutschland) is probably much stronger than initially and generally perceived. The multi-decade trend of slow socialisation of many industrialised/Western societies could be in process of ending. We continue to believe that the EU is, if not socialist, then certainly paternalist, and is, if not anti-democratic, then certainly un-democratic, and continues to weaken structurally. Given the empirical evidence that all fiat money systems eventually go to zero, we currently do not know what will come first, the abandonment of the Euro—a proxy for the EU's constructional flaws and political ineptitude—or a new global currency system.
- One interpretation of history could be to call those who now argue that the election of a narcissistic egomaniac will turn out to be just alright appeasers.
- As *The Economist* put it: "History is back—with a vengeance."

"At the end fiat money returns to its inner value – zero."
—Voltaire

Main messages and important changes

Table lists the most recent main messages from our research reports as well as the most important changes.

IR&M publications	Frequency per year	Page count
Risk management update	20-25	60-100
Flash update	25-50	1-20
Earnings momentum monitor	25-40	3

Global econ. growth: falling

The average growth rate was above 2% at around 2.1-2.7% from Q2 13 to Q4 14. The range in 2015 was 1.6-1.9%, i.e., lower. The average rose in Q1 16 and was rising in Q2 16 too.

*The most important thing
Average growth rate is
low and falling.*

*Higher and better than expectations.
However, Q2 was revised down to 0.6%
from 0.8%.*

*Higher and better than the +1.5% that
were expected.*

Source: IR&M, Bloomberg. Notes: Based on real GDP, y/y, SAAR (seasonally adjusted annual rate). The average is equally weighted. Δ=Direction of latest change. SD=Latest change that exceeds one standard deviation is marked with a green or red dot. If country name is green/red, latest figure is better/worse than expected.

OECD leading indicators: stable

These OECD "leading" indicators are lagging. The main benefit of these indicators is the trending properties, i.e., a trend in a certain direction can last for years.

The trend is negative based on the composite index but the falls are minor, i.e., only visible when looking at second decimals. The four BRICs are improving.

Oct 2007 to Jun 2016

US stopped falling and is stable.

Brazil has been rising since August 2015. September 2016 was a 1.5 standard deviation (sd) rise.

China stopped falling a couple of months ago, reversed and now seems rising.

India, rising since 2012, rose by 1.6 sd.

Russia continues its ascent.

New Zealand continues to rise with a 1.1 sd rise in September.

Source: IR&M, Bloomberg, OECD. Notes: △=Direction of trend, i.e., at least three consecutive changes in the same direction. SD=Latest change that exceeds one standard deviation is marked with a green or red dot.

Industr. production: **positive**

Industrial production (IP) is perceived as a coincident economic indicator but is of higher frequency than GDP data.

Lower and below expectations on m/m basis (y/y is shown).

Lower but better than expected on m/m basis.

Higher.

Unchanged, slightly below expectations.

Higher and better than expected.

Source: IR&M, Bloomberg. Notes: Based on y/y industrial production. Industrial production is generally perceived as a lagging indicator. The average is equal weighted. In the case of a figure not available, the previous one is used to calculate the latest average. △=Direction of latest change. SD=Latest change that exceeds one standard deviation is marked with a green or red dot.

Business sentiment: rising

*The most important thing
Sentiment is rising.*

Table shows a selection of indicators for business sentiment. The average is measured as average percentile of the indicators. A 4-point move of the average represents one standard deviation.

The average rose by 0.7 standard deviation (sd) in July and fell by 1.2 sd in August. The September rise was 1.2 sd and the October rise is a 0.2 sd rise so far. The most recent peak of the average was at 73.1 in April 2014.

Consumer sentiment: rising

*The most important thing
Sentiment is rising.*

Table shows a selection of indicators for consumer sentiment. The average is measured as average percentile of the indicators. A 4-point move of the average represents one standard deviation.

The average has peaked at 78 in March 2015 and oscillated downwards since then. May and June were both 0.7 standard deviation (sd) rises. July was a 1.0 sd fall, and August a 0.3 sd rise. September was a 0.5 sd rise and October and November are +0.04 sd rises so far, i.e., pretty much unchanged.

A 1.1 sd rise, beating expectations.

Higher, with the survey probably taken prior to 8th November.

Marginally lower with general trend unclear.

Source: IR&M, Bloomberg. Notes: The average is equal weighted and is calculated from percentiles. △=Direction of latest change. SD=Latest change that exceeds one standard deviation is marked with a green or red dot.

US high frequency indicators: **improving**

This gap is big. It's a proxy for the portion of stock market performance that was liquidity driven. This implies a S&P 500 level of 1000-1100 without the central planners generosity.

Red flag from falling yield curve disappeared over night.

Source: IR&M, Bloomberg. Table shows eleven variables that are of higher frequency and supposedly have predictive power for the US (and or global) economic cycle. "W" stands for calendar week number.

US small biz sent.: uptick

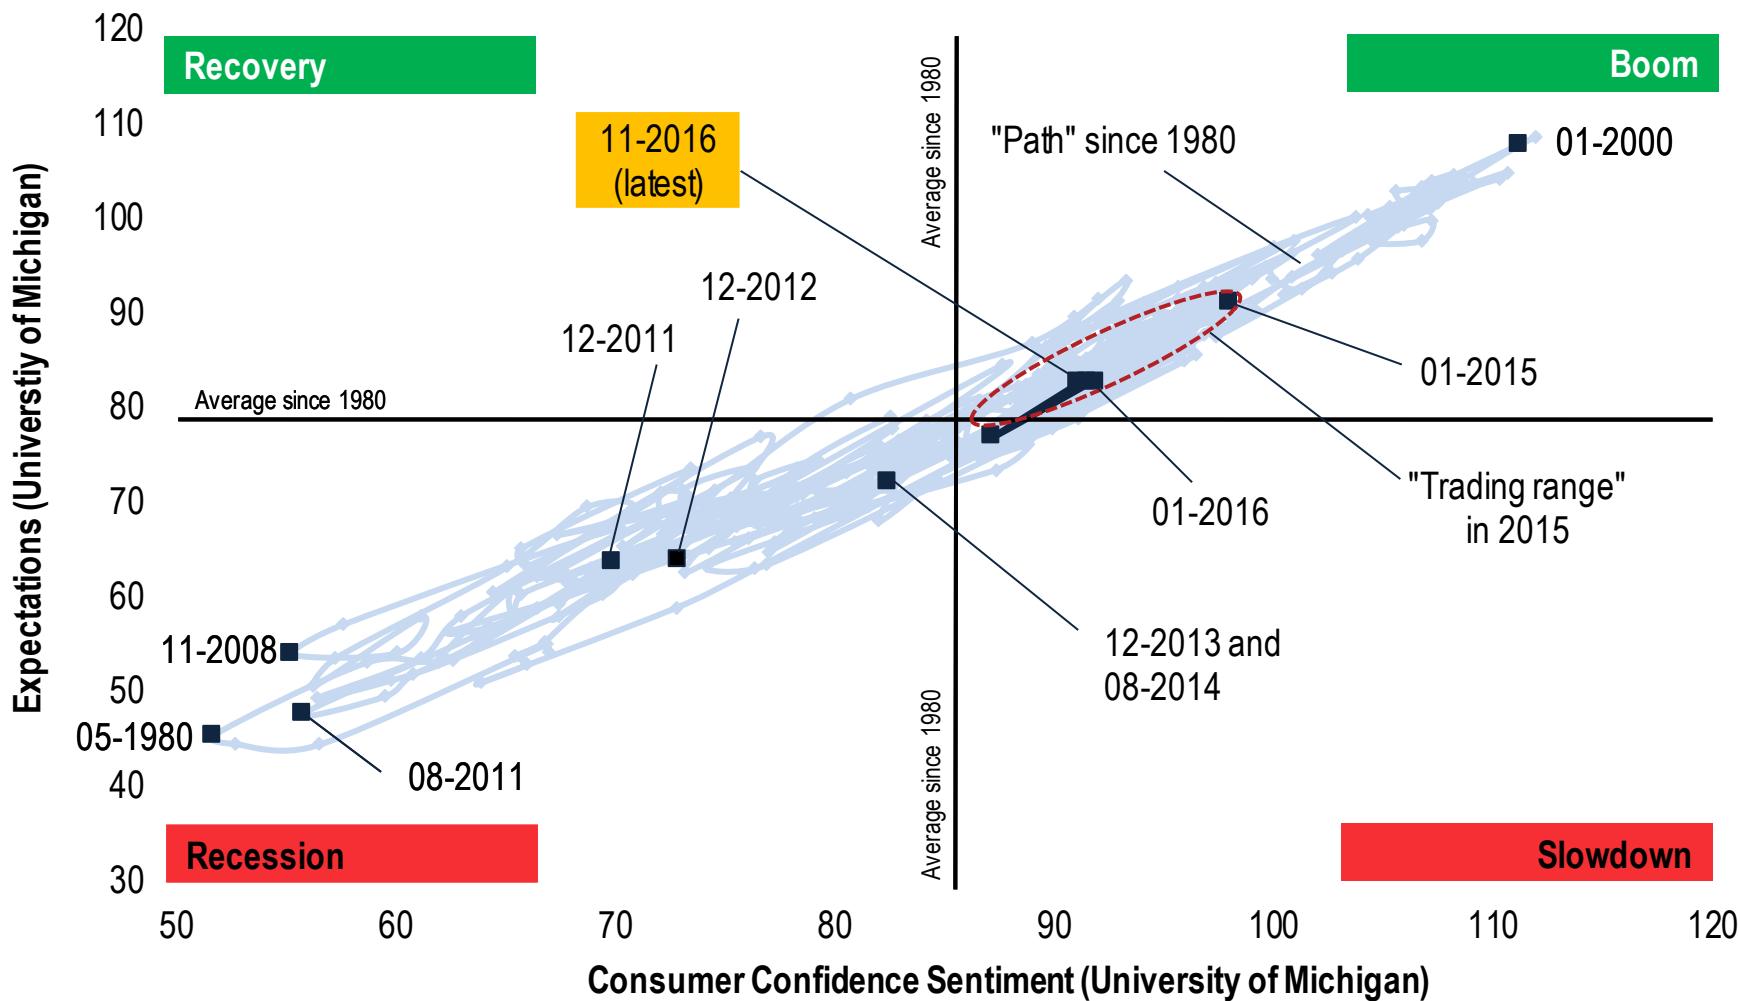

Given how the US changed last Wednesday, surveys taken prior to Trump's victory could be misleading. This survey, published last Tuesday, was overall positive, which is at least consistent with the market's (delayed) reaction to the upcoming all-Republication epoch.

Source: IR&M, Bloomberg. Notes: Based on NFIB Small Business Optimism Survey. Extr.?: Flag indicates 8-year extreme. *Changes > 1 standard deviation marked red or green.

US consumer: full bounce back

These two indicators fell by 0.8 and 1.3 standard deviation in October, i.e., a meaningful move in the wrong direction. They bounced back fully in November and are now where they were in September as well as January of this year.

Source: IR&M, Bloomberg. Note: The light blue line shows all combination of consumer confidence sentiment (main index) and expectations thereof since January 1980. Most recent path is highlighted.

Germany factory orders: **negative surprise**

Negative y/y factory orders are often associated with corresponding negative returns in the equity indices.

Factory orders fell by 0.6% m/m (graph shows y/y) in September which compares to +0.2% being expected.

Source: IR&M, Bloomberg.

Japan machinery orders: ok-ish

Graph contrasts machinery orders* with 2-year price returns in the Nikkei 225 Index. In 72% of occurrences where machinery orders were negative, the 2-year return for the Nikkei 225 was negative too.

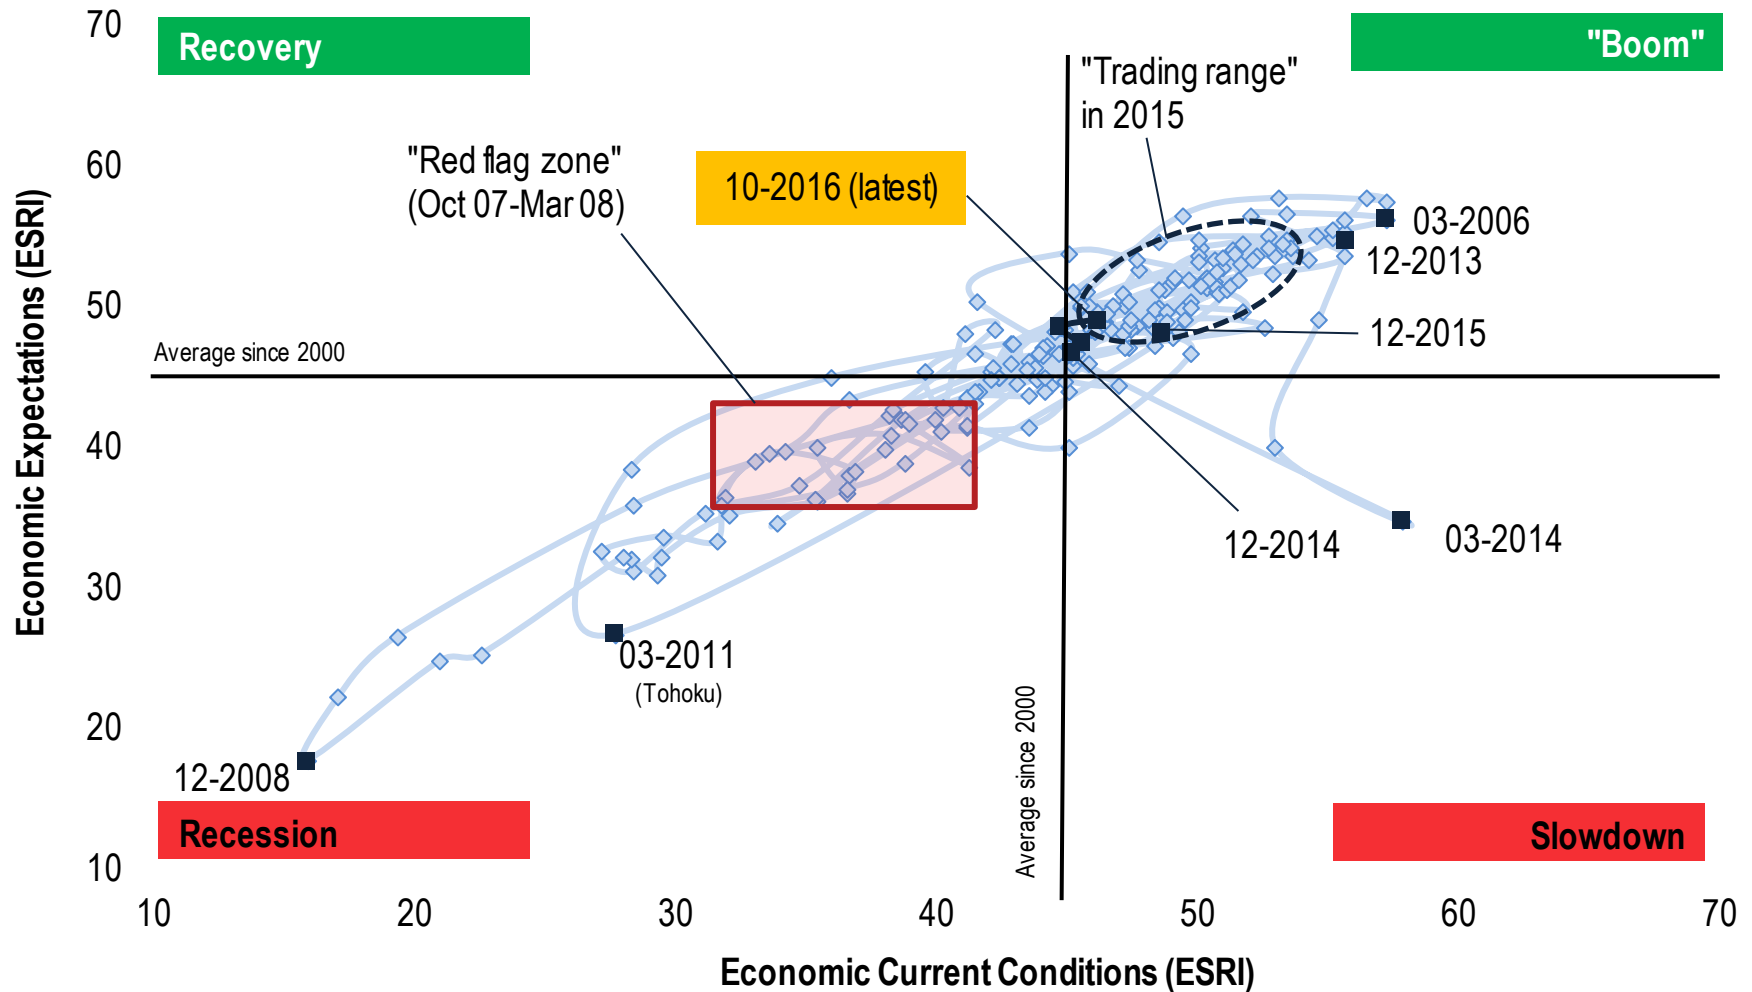

Machine orders in September at +4.3% y/y were positive and a bit better than the +4.1% that were expected.

Source: IR&M, Bloomberg, Economic and Social Research Institute Japan. *Machinery Orders in private sector excl. volatile orders (y/y).

Japan: improving

This survey moved out of the "red flag zone" with a vengeance in July. The latest move for October was a positive with the indicators beating expectations.

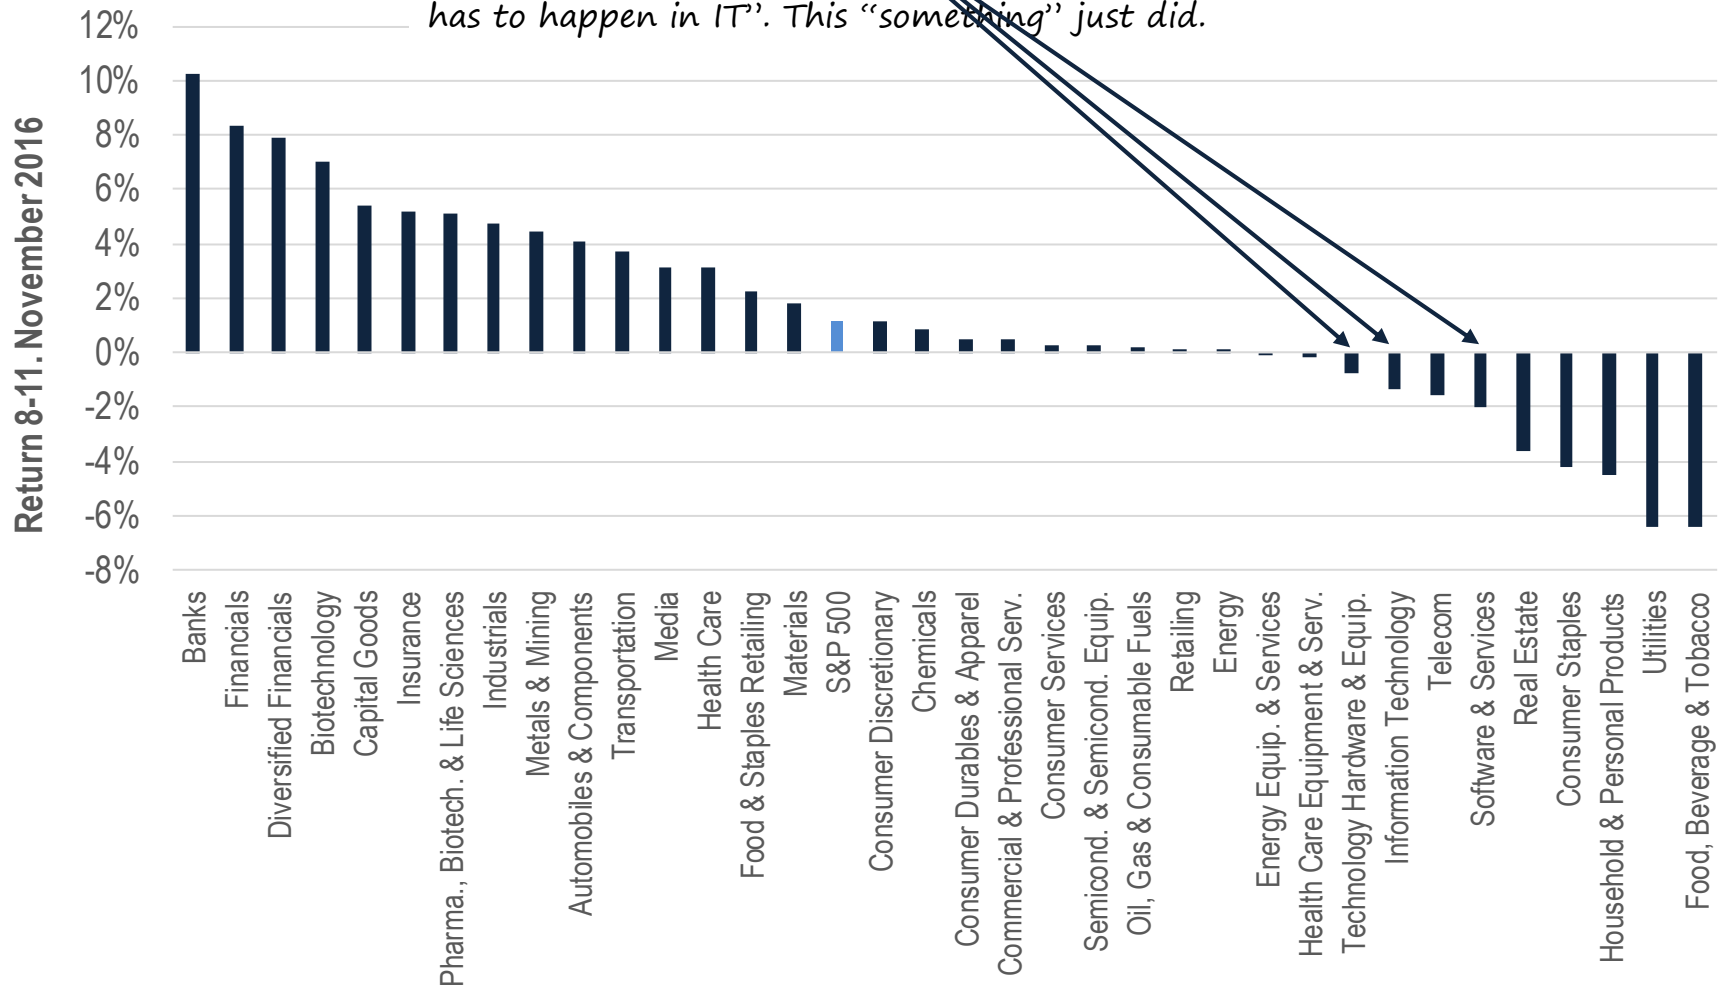

Source: IR&M, Bloomberg. Note: cross bars are based on averages since 2000.

US sector returns: extreme dispersion

Graph shows post-election, 3-day return to 11th November of a selection of US sector and industry indices.

The bar chart shows a first indication as to the potential winners and losers of a Trump administration. IT is a potential loser. It is IT that is the main variable determining whether the US (the S&P 500) continues to outperform most other indices. We always said for the outperformance to end, "something bad has to happen in IT". This "something" just did.

Source: IR&M, Bloomberg.

Equities sector performance comparison

Table compares 2016 performance of S&P 500 sectors and a selection of industries with the closest equivalent in Europe and Japan in local currency.

Table shows 2016 local currency (lc) returns to 11th November. US outperformed in 26 out of 32 cases, Europe in 5, and Japan in one. We are still quite comfortable having a "US bias," both in nominal (shown) and in real terms (not shown here). However, we'll need to keep an eye on IT, as mentioned.

Long-term momentum in European Banks has been turning positive over the past 19 weeks and continues to do so.

Source: IR&M, Bloomberg. Table shows a selection of European banks and was sorted by year-to-date (YTD) total returns (TR). Volat. (1Y)=1-year historical volatility. *P&L: hypothetical profit or loss had one bought/sold on the Monday following the signal. **Latest share price in percentage of all-time high. *** Price-to-book ratio, for what it's worth.

Target rates: low and not rising

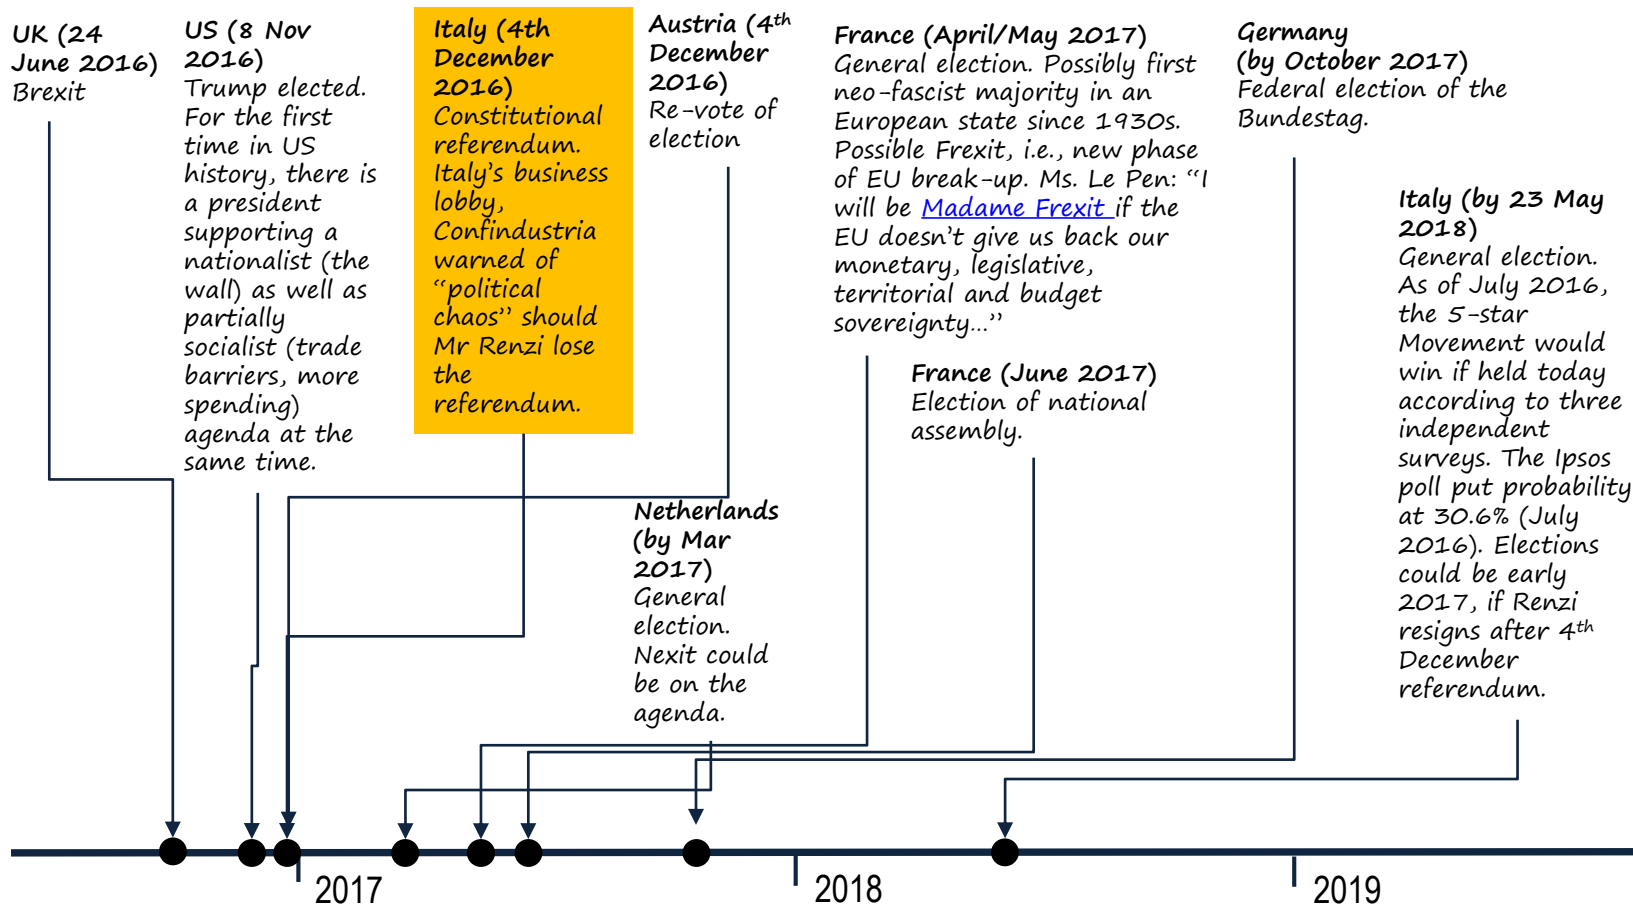

The Reserve Bank of New Zealand cut rates 25bps to 1.75%, but indicated that future cuts were unlikely after forecasting inflation heading back toward its target range.

10-year range		Target rate					Easing?	Yield

Political risk: notable dates

The purpose of this slide is to keep an eye on future dates that could mark turning points or trigger structural change.

"The past may not repeat itself, but it sure does rhyme."

—Mark Twain

"Chance favours only the prepared mind."

—Louis Pasteur

Food for thought

We showed the table below on 28th May and left it unchanged. (The probabilities have changed, obviously.) The key variable to watch is, we believe, the separation of power, i.e., the potential melting of the three constitutional branches, executive, legislative, and judicial. At the moment there are only a few market observers calling the US a "banana republic" and we are not among them. However, one still ought to keep an eye on the concentration of power. In the US mainly, but elsewhere too.

	Probability	Eight factors that help characterise national socialism								Sum of ticks
		Nationalistic and/or racist and/or strongly anti-immigration	Concentration of power/ limitations to democracy	Advocate protectionist and/or interventionist policies	Expropriation of wealth/ limited property rights	Surveillance and/or limited civil rights	Combative/ limited aversion to war	Traditionalism/ rejection of modernism and/or machismo	Populist/ benefits from broad social frustration	
The past										
Germany & Italy - 1930s		✓	✓	✓	✓	✓	✓	✓	✓	8
The present										
Germany - current				✓						1
France - current				✓						1
Italy - current				✓	✓					1.5
Hungary - current		✓	✓	✓	✓	✓		✓	✓	6.5
EU in general			✓	✓	✓					2.2
US - current				✓						1
Russia - current		✓	✓	✓	✓	✓	✓	✓	✓	8
Potential future										
France - under Le Pen	<20%	✓	✓	✓	✓	✓			✓	5.5
Germany - under Pety	<5%	✓		✓				✓	✓	4
US - under H. Clinton	~80%			✓						1
US - under Trump	~20%	✓		✓		✓	✓	✓	✓	6

Graph of the week – for what it's worth...

Graph shows all 192 occurrences where the S&P 500 future closed more than 3% above the intraday low of the day since 1982.

At one level, the stock market move from last Wednesday "felt" very unusual. However, it could be that we're just not used to such intraday swings anymore.

192 occurrences where S&P 500 future closed more than 3% above intraday low

Source: IR&M, Bloomberg. Note that trading hours have changed multiple times during the period shown.

Trivia

We were reminded of this classic image last week.
